FOR IMMEDIATE RELEASE

## KINETO SMART WI-FI APPLICATION AVAILABLE FOR ANDROID 2.2

*Kineto delivers UMA technology for Froyo, the newest version of Android Operating System*

---

### Milpitas, Calif., September 20, 2010

Kineto Wireless, Inc., the key innovator and leading supplier of solutions that enable delivery of mobile services over broadband, today announced it has an updated version of its Smart Wi-Fi Application for Google's Android operating system version 2.2, also called Froyo.

Kineto's Smart Wi-Fi Application, based on the 3GPP UMA/GAN standard, turns existing Wi-Fi access points into seamless extensions of the mobile network. Using the Smart Wi-Fi application, subscribers can now resolve indoor mobile coverage problems by receiving their voice and data services over existing Wi-Fi access points.

"Smartphones have highlighted the coverage and capacity challenges of mobile networks, especially in indoor locations. Operators have started to look to Wi-Fi, already installed in many homes and offices, to address these issues," said Mark Powell, vice president and general manager of Kineto's Client Business Unit and co-founder of the company. "To capitalize on this growing demand, we have now enhanced our Smart Wi-Fi Application to support the latest version of Android and validated it with the leading Android smartphone manufacturers."

Kineto's Smart Wi-Fi Application is designed for mobile operators to address the network coverage and capacity issues created by the growing popularity of smartphones and subscriber demand for bandwidth intensive applications and services. The company works with device manufacturers and mobile operators to pre-load the application onto devices.

Wi-Fi continues to be the predominant wireless technology in the home. A study conducted by Arbitron earlier this year found that 62 percent of US broadband-connected households already had Wi-Fi installed. Market research firm In-Stat projects that by 2013, shipments of mobile phones with embedded Wi-Fi will exceed ¾ of a billion units. Kineto's Smart Wi-Fi Application enables mobile operators to extract the maximum benefit of Wi-Fi for their networks and their subscribers.
